The Bounine Method

Fundamental purpose

A new therapeutic approach

An osteotherapeutic approach: care of the bones, therapy through the bones. The bone is a living tissue, elastic with a 30% water content.

It is the living memory of the individual.

The bone is also the tissue which acts as the frame for the body and gives it shape.

Two innovative concepts

- Balance of the pelvis
- Liberation of the traumatic bone memory

Respect for the fundamentals

- Anatomy and biomechanics
- Prevention

A rhythm

- 5 basic sessions on average over 2-3 years
- 1 annual preventive session recommended

Giving hope

Experience again your real physical and emotional base through a recovery of the original equilibrium and maintenance of this equilibrium in space and time.

« *Being in shape means being in your own shape* »

A universal method

- From birth to old age
- Whether sedentary or a high-performance sports-person
- Whether in good health or suffering from an ailment.

A technique : MPO

(Postural Osteotendon Massage)

The therapist treats the patient by means of long, firm finger pressure on the points where the muscles, the aponeurosis and the ligaments are attached to the bones. This treatment frees up the body tissues, releasing the tensions stamped upon the body due to traumatic events and suffering endured during the patient's lifetime. Subsequently an assessment and realignment of the pelvis are carried out.

Its originality

The method has been perfected by treating high-performance sports people, where officially prescribed techniques did not produce results.

A response

- Why am I in pain ?
- What is making feel in pain ?
